

Build a modern dark-mode SaaS web app called "EmailIQ" using Next.js App Router, Tailwind CSS, shadcn/ui, and Lucide icons.

Create a TypeScript interface for the 'Email' object." This ensures that the Inbox page, the Detail Sheet, and the Analytics page all use the same data structure, making it much easier for you to connect a real AI later.

Break the UI into small, reusable components in the `@/components` folder.

Wrap all Recharts components in a `<ResponsiveContainer />`

Style direction:

- Inspired by Linear, Superhuman, and Motion
- Dense but elegant productivity UI
- Dark shell with muted sidebar, elevated cards, soft borders, and vivid analytics accents
- Use Inter font
- 8px spacing system
- Rounded 2xl cards, xl controls, full rounded badges
- Background #0F1115
- Sidebar #151922
- Card #181C25
- Border #2A3140
- Primary text #F4F5F8
- Secondary text #A6ADBB
- Accent purple #8B7CFF
- Success green #3DD9A3
- Warning amber #FFB84D
- High priority red #FF5D73
- Info blue #55C2FF

App structure:

- Left sidebar with nav items: Inbox, Analytics, Demo Mode, Settings
- Top header with page title, search input, and filter controls
- Main dashboard page with 4 KPI cards:
 1. Total Unread
 2. Urgent Emails
 3. Noise Reduced Today
 4. Estimated Time to Clear Inbox

Main content:

- A prioritized email list/table with columns:
 - sender
 - subject
 - category badge

- urgency score
- recommended action
- received time
- Each row should feel clickable and polished
- Clicking a row opens a right-side detail sheet

Detail sheet:

- AI Executive Summary with 3 bullet points
- Tags for category, urgency, sentiment, and action required
- Buttons:
 - Draft Reply
 - Snooze
 - Archive
 - Add to Task List

Analytics page:

- Recharts components showing:
 - donut chart for email category breakdown
 - bar chart for email volume over last 7 days
 - line chart for focus score over the week
 - horizontal bar chart for top distracting senders
- Include 3 AI insight cards above the charts

Data:

- Use realistic mock email data for a corporate worker named Alex
- Include categories like Client, Internal, Recruiting, Finance, Logistics, Newsletter
- Include urgency states High, Medium, Low
- Include recommended actions Respond, Review Later, Delegate, Archive

Design requirements:

- Use p-5 for cards, px-4 py-3 for email rows, px-3 py-2 for sidebar items
- Keep the interface premium, fast, and presentation-ready
- No gradients except subtle chart accents
- Strong hierarchy, minimal clutter, crisp typography

Implement this using a 'Mock Data' file. Use **Lucide-react** for icons and ensure the sidebar uses a 'collapsed' state for smaller screens.

// Add this data structure to the project logic:

```
interface Email {
  id: string;
  sender: {
    name: string;
```

```

    email: string;
    avatarUrl?: string;
  };
  subject: string;
  bodyPreview: string;
  receivedAt: string; // ISO format
  category: 'Client' | 'Internal' | 'Recruiting' | 'Finance' | 'Logistics' | 'Newsletter';
  urgency: {
    label: 'High' | 'Medium' | 'Low';
    score: number; // 0 to 100
  };
  analysis: {
    summary: string[]; // 3 bullet points
    sentiment: 'Urgent' | 'Formal' | 'Casual' | 'Frustrated';
    detectedDeadline?: string;
    suggestedAction: 'Respond' | 'Review Later' | 'Delegate' | 'Archive';
  };
  isRead: boolean;
  isActioned: boolean;
}

```

2.

Refine the EmailIQ inbox page to feel more like a premium productivity app. Ensure the right-side detail sheet uses the Radix UI / Shadcn 'Sheet' component. When a row is clicked, pass the specific email object data into the sheet so the summary matches the selected email

Changes:

- Add keyboard-command style quick actions in the header
- Add tabs above the inbox list: All, Action Required, Today, This Week, Noise
- Add compact badges with semantic colors
- Improve the selected row state
- Add hover states, subtle separators, and stronger alignment
- Add a top banner for demo mode:

"Meet Alex — 47 unread emails, 5 urgent, 32% noise reduced today"
- Make the right-side detail panel richer with:
 - key request
 - detected deadline
 - next best action
 - one-click response suggestions

- Keep spacing tight and polished like a high-end SaaS product

3. Expand the Analytics page in EmailIQ.

Add:

- A top summary strip with:
 - Focus Score
 - Actionable Email Rate
 - Average Triage Time
 - Estimated Time Saved
- A sender insights section with a ranked list of top senders by interruption load
- A topic insights section with tags for recurring themes
- A stacked bar chart showing urgent vs non-urgent emails by day
- An area chart showing inbox load by hour of day
- Insight cards with AI-generated recommendations such as:
 - "Batch internal updates into one daily review block"
 - "You spend the most time on status emails between 9–11 AM"
 - "Archive newsletters by default to reduce noise"

Make the charts cohesive with the dashboard palette and keep the layout presentation-ready.

For the AI insight cards, use a 'Glassmorphism' effect with a subtle **backdrop-blur**.

Make the 'Actionable Email Rate' a circular progress gauge to add visual variety to the bar and line charts.
